

Abstract of the Invention

A plant package includes a flower pot containing a floral grouping and a flexible sleeve which may be provided with detaching elements at preselected areas. The sleeve may further include a bonding material which connects the sleeve to the flower pot when the flower pot is positioned within the sleeve. When the sleeve is positioned about the flower pot, a lower portion of the sleeve closely surrounds and encompasses the flower pot, and an upper portion of the sleeve extends upwardly from the flower pot and substantially surrounds and encompasses the floral grouping contained within the flower pot. At least a portion of the sleeve is removable via the detaching elements, leaving a portion of the sleeve which forms a decorative plant cover.
